METEOROLOGISCH INSTITUUT

Seismic Records
at De Bilt

Jaargang 39-1951

De Bilt 1957

P R E F A C E

This seismic Yearbook was composed under the supervision of Dr.J. Veldkamp director of the Geophysical Section. The records have been reduced by Mr. J. Oldeman, scientific assistant.

The Director in Chief of the Royal
Netherlands Meteorological Institute,
Ir. C.J. Warners.

De Bilt, December 1955

INTRODUCTION

SEISMOLOGICAL STATION DE BILT

The geographic coordinates of the seismological station are: $52^{\circ}6'1''$ N and $5^{\circ}10'6''$ E. The instruments are placed at a height of 3 m above mean sea-level on a subsoil consisting of sand (pleictocene).

The instruments are:

a set of seismographs (two horizontal and one vertical) with galvanometric recording according to GALITZIN,

one astatic horizontal seismograph according to WIECHERT, $M = 200$ kg,
two horizontal pendulums according to Bosch, $M = 25$ kg.

THE GALITZIN SEISMOGRAPHS AT DE BILT. Below are given: the period of the galvanometer T_1 , the reduced pendulum length l , the distance A_1 between the mirror of the galvanometer and the rough values for the natural period T of the undamped pendulum, of the damping constant μ and of the multiplying factor k for the year 1951.

	NS comp.	EW comp.	Z comp.
Period of galvanometer T_1	24.43 sec	24.96 sec	12.0 sec
Reduced length of pendulum l	123 mm	123 mm	406 mm
Distance A_1	1380 mm	1380 mm	1380 mm
Period of pendulum T	25 sec	25 sec	12 sec
Damping constant μ	0.0	0.0	0.0
Multiplying factor k	11.0	11.0	175

THE WIECHERT AND BOSCH SEISMOGRAPHS AT DE BILT. The mean values of the natural period of the undamped pendulum T , of the damping ratio ε and of the static magnification V for the year 1951 are:

	T	ε	V
WIECHERT (NS comp.)	5.0 sec	4	170
(EW comp.)	5.0 sec	4	170
BOSCH (NS comp.)	18.0 sec	4	20
(EW comp.)	18.0 sec	4	20

SEISMOLOGICAL STATION HEERLEN

The geographic coordinates of the seismological station are: $50^{\circ}53'0''$ N and $5^{\circ}59'0''$ E.

The instrument, a horizontal seismograph, $M = 450$ kg, is placed at a height of 100 m above mean sea-level on a subsoil consisting of loess.

The mean values of the constants for the year 1951 are:

T	ε	V	V max.	T max.
2	3	400	600	2

SEISMOLOGICAL STATION WITTEVEEN

The geographic coordinates of the seismological station are: $52^{\circ}48'8''$ N and $6^{\circ}40'1''$ E.

The instrument, a GRENET vertical seismograph with galvanometric record, is placed at a height of 2 m above mean sea-level on a subsoil consisting of pleistocene sand.

Recording started in April 1951.

The period of the seismograph is 2.3 sec, the period of the galvanometer is 0.8 sec. The maximum amplification is 6500 for a period of about 1 sec.

EXPLANATION OF THE TABLES

The data given in this Yearbook have mostly been obtained from the GALITZIN records. The velocity of the recording paper is 30 mm per minute, allowing a good time-accuracy. Only when the earthquake was extraordinarily severe, so that the GALITZIN records could not be analyzed, the records of the WIECHERT and BOSCH seismographs were used. The velocity of the paper of these seismographs is 10 mm and 15 mm per minute respectively. Whenever the WIECHERT and BOSCH records were used, this has been mentioned in the column 'remarks'.

In a few cases the data from the seismograph at Heerlen are mentioned. The time is Greenwich mean time.

In the column 'direction' + means an upward movement of the soil (compression), - means a downward movement (dilatation). Uncertain data have been given in parentheses. The following symbols were used for the phases.

P	=	normal first phase, or first longitudinal tremor.
PP	=	P-wave once reflected at the earth's surface near the epicentre.
PP	=	P-wave reflected halfway between epicentre and station.
PPP	=	P-wave two times reflected at the earth's surface.
PPPP	=	P-wave three times reflected.
S	=	second phase, arrival of the transversal tremor.
SS	=	S-wave reflected at the earth's surface near the epicentre.
PS	=	wave changed from longitudinal to transversal oscillation through reflection at the earth's surface.
PPS	=	wave twice reflected, having been transversal on one branch of the path.
SS	=	S-wave reflected halfway between epicentre and station.
SSS	=	S-wave two times reflected at the earth's surface.
SSSS	=	S-wave three times reflected at the earth's surface.
PcP	=	P-wave reflected at the core boundary.
ScS	=	S-wave reflected at the core boundary.
P'	=	PKP = wave having penetrated the core.
S'	=	SKS = transversal wave, having been longitudinal within the core.
PKS	=	alternating wave having penetrated the core.
PP'	=	P'-wave reflected near the epicentre.
SS'	=	S'-wave reflected near the epicentre.
SKKS	=	Alternating wave which has been reflected within the core.
L	=	long waves or surface waves.
M	=	maximum of the surface waves.
L'	=	surface waves travelling around the major arc.
M'	=	maximum of these waves.
i	=	sudden beginning of the phase.
e	=	gradual beginning of the phase.
F	=	end of discernable movement.
H	=	time of the shock at point of origin.
h	=	depth of the origin.
Δ	=	distance of epicentre.

The indices H, N, E, and Z refer to the horizontal, north-south, east-west and vertical components of the movement.

The distance of the epicentre and the depth of origin have been calculated by means of curves constructed with the aid of the time tables of Jeffreys and Bullen (1940).

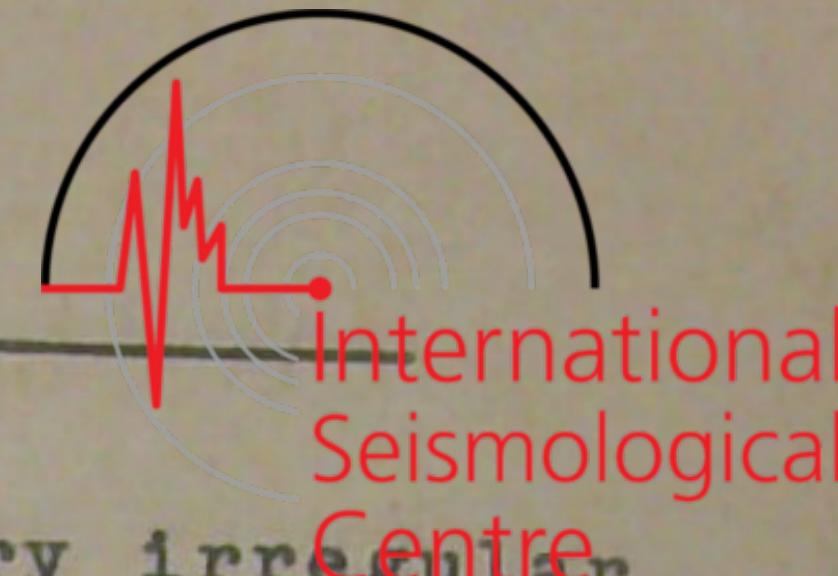

The data given in the column 'amplitude' are the maximal amplitudes measured from the medium line. The amplitudes have been calculated by means of the formula:

$$V = \frac{A_1 k T_b}{\pi l} \cdot \frac{1}{\left\{ 1 + \left(\frac{T_b}{T} \right)^2 \right\}^2}$$

In this formula A_1 is the distance between galvanometer mirror and recording paper, k is the multiplying factor, T_b the period of the wave, l the reduced length of the pendulum, T the free period of the undamped seismograph, and V the magnification. The period of the galvanometer is assumed to be equal to the free period of the undamped seismograph.

For the horizontal components of the Galitzin records the following mean values were used: $k = 11,0$ and $T = 24.5$ sec, and for the vertical component $k = 175$ and $T = 12.0$ sec.

Whenever it was possible the amplitudes and periods of the first P-and S-waves have been given. As the movement of these waves is irregular in general, the accuracy of these data is small. The amplitudes of the maxima of L-waves have been calculated in case of very strong earthquakes.

The amplitudes have been omitted when the oscillations were very irregular.
The seismological bulletins of the following stations were available:
Algeria, Alicante, Almeria, Athens, Azores, BCIS (Bureau Central International de Seismologie), Beograd, Bogota, Brisbane, CMO (Japan), Coimbra, Columbia University (Palisades N.Y. and Bermuda), Djakarta, Dublin, Firenze, Geophysics Division (New Zealand), Granada, Harvard University, Helsinki, Helwan, Hermanus, Huancayo, Istanbul, Jena, John Carroll University (Cleveland), JSA (Jesuit Seismological Association), Kew, Ksara, La Paz, Lisboa, Manila, Nanking, Paris Pasadena, Perth, Poona, Potsdam, Praha, Prato, Reykjavik, Riverview N.S.W., Roma, Santiago (Chile), Seismographic Stations of the University of California, Seismological Service of Canada, Stuttgart, Tacubaya, Taiwan, Tananarive, Toledo, Trieste, Uppsala, USCGS (United States Coast and Geodetic Survey), Western Samoa, Weston (Mass.), Wien, Zürich.

THE MICROSEISMIC ACTIVITY

The table on page VIII shows the character of the microseismic activity (see also 1915 p. 101 and 1916 p. 101). The numbers 0, 1, 2 and 3 mean:

- 0 very weak and weak
- 1 moderate
- 2 strong
- 3 very strong

For measuring the microseismic activity the records of the GALITZIN seismograph were used. The table below gives the amplitudes of the oscillations (measured from the medium line) and the corresponding amplitudes of the movement of the surface.

Character	Ampl. record	Ampl. surface
0	0 - 1/2 mm	0 - 1 1/4 mm
1	1/2 - 2 ,,	1 1/4 - 5 ,,
2	2 - 4 ,,	5 - 10 ,,
3	4 ,,	10 ,,
