## SYMBOLS AND NOTATIONS

## 1. Character of the Earthquake—

I. Perceptible. II. Moderately strong. III. Strong.

d (terrae motus domesticus)	Local shock (origin less than 100 kilometers distant).
v (terrae motus vicinus)	Near shock (origin from 100 to 1,000 kilometers distant).
r (terrae motus remotus)	Distant shock (origin from 1,000 to 5,000 kilometers distant).
u (terrae motus ultimus)	Very distant shock or teleseism (origin more than 5,000 kilometers distant).

## 2. Phases of the Seismogram—

P (undae primae)	Normal first phase, or first preliminary tremors.
$\bar{P}$	Individual, or upper first preliminary tremors.
PR <sub>n</sub>	Waves n-times reflected at the earth's surface.
S (undae secundae)	Second phase, or second preliminary tremors.
SR <sub>n</sub>	Waves n-times reflected at the earth's surface.
PS	Waves changed from longitudinal to transverse oscillation, or vice versa, through reflection at the earth's surface.
L (undae longae)	Long waves at the beginning of the surface phase.
Q (undae quartae)	Shorter and more regular waves in the surface phase.
M (undae maximae)	Greatest motion in the surface phase, usually in the group here defined as Q.
C (coda)	Tail or end portion.
F (finis)	End of discernible movement.

## 3. Nature of the Motion—

i (impetus)	Sudden beginning of the motion.
e (emersio)	Gradual beginning of the motion.
T (period)	Time of one complete oscillation.
A	Amplitude of the earth motion, measured from the median line in microns ( $\mu = 1/1000$ mm.) for the Berkeley Station; and for the Lick Observatory Station, the unreduced seismogram amplitude measured from the median line in millimeters, + toward the north, east, or zenith, - toward the south, west, or nadir.
A <sub>E</sub>	E-W component of A.
A <sub>N</sub>	N-S component of A.
A <sub>Z</sub>	Vertical component of A.

## 4. Time—

O (origin)	Time of shock at point of origin.
------------	-----------------------------------

## THE BERKELEY STATION

## CONSTANTS

Latitude and longitude of the center of the seismographic room:

$$\varphi = 37^\circ 52' 15.''9 \text{ N. Lat.}$$

$$\lambda = 122^\circ 15' 36.''6 \text{ W. from Greenwich.}$$

Time. All determinations are reduced to Greenwich mean civil time.

Altitude, 85.4 meters (280 feet) above mean sea level.

										This seems to have been a double earthquake from the same epicenter, the second being the stronger shock. While the S-P intervals are identical for both shocks, they give a distance 2°2 that is somewhat too great as compared with the distance 1°4 determined in the same manner from the Lick records. It is probable that only P was recorded in each case. The earthquake was reported felt in Fresno and Bakersfield, Calif.

## THE LICK OBSERVATORY STATION

## CONSTANTS

## CONSTANTS OF THE STATION

Latitude and longitude of the center of the seismographic room:

$$\varphi = 37^\circ 20' 24\frac{1}{2} \text{ N. Lat.}$$

$$\lambda = 121^\circ 38' 34'' \text{ W. from Greenwich.}$$

Time. All determinations are reduced to Greenwich mean civil time.

Altitude, 1281.7 meters (4202.25 feet) above mean sea level.

The junior author is responsible for the measurement of the seismograms of the Lick Observatory Station as here reported.
